In the table below, we discuss the **Key Benefits**:

Categories	Description	Example / Value
<b>Cost Saving</b>	<ul style="list-style-type: none"> <li>• Pay-as-you-go pricing</li> <li>• No upfront capital expenses</li> </ul>	Avoid buying Physical servers, you just have to pay for what you use
<b>Agility</b>	Quickly deploy, test, and scale new ideas and applications	Launch a global app in hours instead of months
<b>Governance</b>	<ul style="list-style-type: none"> <li>• Risk managers</li> <li>• Finance</li> <li>• Compliance</li> </ul>	<ul style="list-style-type: none"> <li>• Budgeting</li> <li>• Cloud Policy</li> <li>• Compliance</li> <li>• License Mgmt.</li> </ul>
<b>Platform</b>	<ul style="list-style-type: none"> <li>• Solution Architects</li> <li>• Infrastructure teams</li> </ul>	<ul style="list-style-type: none"> <li>• Cloud infrastructure</li> <li>• Services</li> <li>• Automation</li> </ul>
<b>Security</b>	<ul style="list-style-type: none"> <li>• Security teams</li> <li>• Risk compliance</li> </ul>	<ul style="list-style-type: none"> <li>• Identity</li> <li>• Access Mgmt.</li> <li>• Threat detection</li> <li>• Data protection</li> </ul>
<b>Operations</b>	<ul style="list-style-type: none"> <li>• IT Operation</li> <li>• Support teams</li> </ul>	<ul style="list-style-type: none"> <li>• Monitoring</li> <li>• Incident Mgmt.</li> <li>• Reliability</li> <li>• Disaster recovery</li> </ul>

In the table below, we discuss the **Financial Benefits**:

Model	Description
<b>CAPEX to OPEX</b>	Avoid capital expenses (CAPEX); shift to operational (OPEX)
<b>TCO Reduction</b>	Total Cost of Ownership can reduce by up to 70% with AWS
<b>Economies of Scale</b>	AWS passes on savings from large-scale infrastructure

**Tip For the Exam:** If you see options like “reduces upfront costs”, “increases agility”, “global reach”, or “enables innovation” they all refer to the business value of AWS.

## 7 R's of AWS Migration (**IMP**)

Strategy	What It Means	Example	Easy Way to Remember
<b>Rehost</b>	Move apps to AWS without changes	Move a VM from on-prem to EC2 as it is	Pick it up and move it (Lift & shift)
<b>Replatform</b>	Move to AWS with some optimizations and no code changes	Move database to RDS instead of EC2	Lift, tweak, shift
<b>Repurchase</b>	Switch to a new product, often SaaS	Replace on-prem CRM with Salesforce	Buy instead of build
<b>Refactor / Re-Architect</b>	Redesign the app for the cloud	Break monolith into microservices on ECS	Change the engine, not the car
<b>Retire</b>	Remove apps you no longer need	Shut down a legacy reporting server	Let it go
<b>Retain</b>	Keep the app on-prem for now	Delay migration for regulatory reasons	Keep it where it is
<b>Relocate</b>	Move entire virtual environments to AWS without app-level changes	VMware Cloud on AWS	Move the data center as it is

## AWS CI/CD Services

Tool	Category	Purpose	Key Features
<b>AWS CodeCommit</b>	Source Control	Fully managed <b>Git-based repository</b> service	<ul style="list-style-type: none"> <li>• Secure private Git repositories</li> <li>• Encrypted at rest &amp; in transit</li> <li>• Integrates with IAM</li> </ul>
<b>AWS CodeBuild</b>	Build Service	Fully managed <b>build and test</b> service	<ul style="list-style-type: none"> <li>• Compiles source code</li> <li>• Runs tests</li> <li>• Produces build artifacts</li> </ul>
<b>AWS CodeDeploy</b>	Deployment	Automates <b>application deployments</b>	<ul style="list-style-type: none"> <li>• Deploys to EC2, Lambda, ECS</li> <li>• Supports <b>rolling &amp; blue/green</b> deployments</li> </ul>
<b>AWS CodePipeline</b>	CI/CD Orchestration	Automates <b>end-to-end CI/CD pipelines</b>	<ul style="list-style-type: none"> <li>• Connects CodeCommit, CodeBuild, CodeDeploy</li> <li>• Visual workflow</li> </ul>

### Easy Memory Trick:

[ C → B → D → P ]

- CodeCommit → Store code
- CodeBuild → Build & test
- CodeDeploy → Deploy application
- CodePipeline → Automate everything
